Glutamic Acid Decarboxylase (GAD) ELISA

For the qualitative determination of GAD in serum

For Research Use Only. Not For Use In Diagnostic Procedures.

Catalog Number: 21-GADHU-E01
Size: 96 wells
I. Intended Use

The GAD ELISA kit is an *in vitro* qualitative ELISA test for the detection of circulating autoantibodies to glutamic acid decarboxylase (GAD) antigen. This kit is for research use only. It is not for use in diagnostic procedures.

II. Background

Insulin-dependent diabetes mellitus (IDDM), Type 1, is caused by the autoimmune destruction of the beta cells of the pancreas (1, 2). This selective autoimmune pathogenesis causes complete elimination of insulin secretion. The immunological evidence was demonstrated by the presence of specific islet cell autoantibodies in IDDM sera (3). At least three autoantibodies have been identified against antigenic components of the islet cells in Type 1 diabetics. These autoantibodies are directed specifically to islet cell antigenic component(s) (4), glutamic acid decarboxylase (5) and insulin (6).

Glutamic acid decarboxylase (GAD) is the biosynthetic enzyme for the neurotransmitter inhibitor gamma-aminobutyric acid, GABA (7). Two forms of GAD, 65 KDa and 67 KDa, are produced by a single gene and are highly homogenous (8-10). 65-KDa GAD and 67-KDa GAD are identified in brain and islet cells and are differentially expressed in human, rat and mouse pancreas (11,12).

III. Principle of the Test

A purified GAD antigen is immobilized onto microwells. GAD specific IgG antibodies present in the serum sample are allowed to react with the antigen. The excess/unbound serum proteins are washed-off from the microwells. An enzyme (alkaline phosphatase) labeled goat antibody, specific to human IgG, is added to the GAD-antibody complex. After washing off excess unreacted enzyme conjugate from the microwells, a substrate (PNPP) is added and the color generated is measured spectrophotometrically. The intensity of the color developed directly gives the concentration of GAD autoantibodies in the test serum sample. GAD high and low controls serve as an internal quality control to ensure valid results.

IV. Warning and Precautions

All reagents provided with the kit are for research use only. Not for use in diagnostic procedures.
1. Potentially Biohazardous Material

The matrix of the Calibrators and Controls is human serum. The human serum used has been found to be non-reactive to HbsAg, anti-HIV 1/2 and anti-HCV when tested with FDA licensed reagents. Because there is no test method that can offer complete assurance that HIV, Hepatitis B virus or other infectious agents are absent, these reagents should be handled as if potentially infectious.

2. Sodium Azide

Some reagents contain sodium azide as a preservative. Sodium azide may react with lead, copper or brass to form explosive metal azides. When disposing of these materials in a sink, always flush with large volumes of water to prevent azide buildup in the plumbing.

3. Stop Solution

Stop Solution consists of 1 N NaOH. This is a strong base and should be handled with caution. It can cause burns and should be handled with gloves. Wear eye protection and appropriate protective clothing. Avoid inhalation. Dilute a spill with water before absorbing the spill with paper towels.

Precautions
1. Do not freeze test reagents, store all kit components at 2-8°C at all times.
2. High and Low Controls must be run each time the test is performed.
3. Use only clear serum as test samples. The test sample should not have gross turbidity, hemolysis, or microbial contamination.
4. All samples should be analyzed in duplicate.
5. Do not mix reagents from different lots.
6. Do not use expired reagents.
7. Do not allow reagents to stand at room temperature for extended periods of time.
8. Do not expose substrate solution to light.
9. Careful pipetting technique is necessary for reproducible and accurate results.

V. Reagents and Materials

Materials Supplied:
1. PLA GAD = GAD-Microwell Strips (with the holder) .................................. 12 strips
2. CONJ ENZ 6X = GAD-Enzyme conjugate (concentrate) .......................... 2 x 1.0 ml
3. DIL SPE 5X = Sample Diluent (concentrate) ........................................... 1 x 25.0 ml
4. CONJ ENZ DIL = Conjugate Diluent ....................................................... 1 x 10.0 ml
5. CAL GAD CAL 1-3 = GAD-Calibrators (1,2,3) (human serum) ............. 1 x 1.5 ml
6. CTRL LLGAD = GAD-Low Control (human serum) ............................... 1 x 1.5 ml
7. CTRL H GAD = GAD-High Control (human serum) ............................... 1 x 1.5 ml
8. SUBS PNPP = Substrate Solution (PNPP) .............................................. 1 x 15.0 ml
9. BUF WASH 25X = Wash Buffer (concentrate) ....................................... 1 x 20.0 ml
10. SOLN STP = Stop Solution (1 N NaOH) ........................................ 1 x 6.0 ml

**VI. ADDITIONAL MATERIALS REQUIRED BUT NOT SUPPLIED**

1. Distilled or deionized water.
2. Absorbent paper towels to blot dry the strips after washing and parafilm/plastic wraps to cover strips during incubations.
3. Suitable sized glass tubes for serum dilution.
4. Micropipet with disposable tips to deliver 10 µl, 50 µl and 100 µl.
5. A microtiter plate washer or a squeeze bottle for washing.
6. 1-5 mL pipets for conjugate diluent delivery.
7. A 500 mL graduate cylinder.
8. Microtiter plate reader with 405 nm absorbance capability.

**VII. Sample Collection**

Collect 5-10 ml of blood by venipuncture into a clot (red top) tube. Serum separators may be used. Separate serum by centrifugation. Serum samples may be stored at 2-8°C. Excessive hemolysis and the presence of large clots or microbial growth in the test sample may interfere with the performance of the test. Freeze the serum sample at -20°C if it cannot be analyzed within 24 hours.

**VIII. Reagents Preparation and Storage**

1. **GAD-Enzyme Conjugate Reconstitution:**
   Accurately transfer 5 ml of the conjugate diluent into the bottle containing 1.0 mL of the enzyme conjugate (concentrate). Close the bottle and mix thoroughly by inversions. Store the diluted conjugate at 2-8°C when not in use. Record the date of reconstitution on the label. **This diluted reagent expires 30 days after reconstitution.** Each bottle contains enough conjugate for 6 strips. Reconstitute as needed.

2. **Sample Diluent Buffer:**
   If precipitate is present in the sample diluent buffer concentrate due to storage at lower temperatures such as 2-8°C, dissolve by placing the vial in a 37°C water bath for 30 minutes. Transfer the entire contents (25 mL) into 100 mL of distilled/deionized water in a suitable container. Mix thoroughly; label the container as Sample Diluent, and store at 2-8°C. The diluted reagent is stable until the expiration shown on the vial. Please note that the precipitate seen in the concentrate has no affect on the performance of the test and will not be present in the 1X working solution.

3. **Wash Solution:**
If crystals are present in the Wash Buffer concentration due to storage at lower temperatures such as 2-8°C, dissolve by placing the vial in a 37°C water bath for 30 minutes. Transfer the entire contents into 480 mL of distilled/deionized water in a 500 mL container. Mix thoroughly; label the container as wash solution, and store at 2-8°C. The diluted reagent is stable until the expiration shown on the vial.

4. **Serum Sample Preparation:**
   Accurately pipet 10 µL (0.010 mL) of serum sample into 1.0 mL of the Working Sample Diluent into an already labeled glass tube. Mix thoroughly.

**IX. ASSAY PROCEDURE**

The test kit contains 12 microwell strips coated with purified GAD antigen. The number of microwell strips used in each assay depends upon the number of serum samples to be tested. If 12 microwell strips are used, a total of 42 serum samples can be tested in duplicate with this kit.

**IMPORTANT NOTE:** Bring all the reagents, including serum samples, to room temperature (25°C) before starting the assay. Incubation temperatures varying by greater than ±1°C can definitely affect results.

1. Assemble the number of strips needed for a test run in the holder provided. The microwell strip must be snapped firmly in place or it may fall out and break.
2. Familiarize yourself with the indexing system of wells, e.g. well number A1, B1, C1, D1, etc. and label the strips used with a marking pen.
3. Dispense 100 µL (0.1 mL) of calibrators, high and low controls, and the diluted serum samples into the appropriate microwells. Wells A1 and B1 are reserved for blank and contain no sample.
4. Cover the plate with a parafilm/plastic wrap (to prevent contamination) and incubate the plate for 1 hour at room temperature (25°C ± 1°C).
5. After a 1 hour incubation, dump the contents of the microwells and blot the plate dry by tapping gently onto a paper towel a few times. If an automatic plate washer is being used, wash each well 3 times with 300 µL (0.3 mL) of the wash buffer solution. If a squeeze bottle is used, fill the wells with the wash buffer carefully and then dump the buffer from the microwells. Avoid air bubbles in the wells during washing. Repeat the washing procedure two more times (i.e., total 3 times). Blot the plate onto paper towel a few times at the end of each wash.
6. Add 100 µL (0.1 mL) of reconstituted Enzyme Conjugate reagent (see #1; Section VIII, Reagent Preparation) to all microwells except wells A1 and B1.
7. Cover the plate with a parafilm/plastic wrap and incubate it in the dark at room temperature (25°C ± 1°C) for 1 hour.
8. At the end of the incubation, wash the microwells three times as described earlier (see step #5).
9. Add 0.1 mL (100 µL) of Substrate Solution to all microwells including wells A1 and B1. Be sure to dispense the substrate reagent at a rapid steady pace without any interruption.
10. Cover the plate and leave it in the dark for 30 minutes at room temperature (25°C ± 1).
11. At the end of 30 minutes after substrate addition, add 50 µL (0.05 mL) of the stop solution into each well at a rapid steady pace without interruption.
12. Blank the plate reader and read the absorbance of the plate at 405 nm. A1 or B1 wells can be used to blank the plate reader. They have no sample, no conjugate, only substrate reagent and stop solution.
13. Calculate the data according to Section X.

**X. Calculation of Data**

For manual calculations, prepare a dose response curve (DRC) on linear graph paper, plotting each calibrator value (as indicated on the calibrator vial label) on the X-axis and its corresponding absorbance value on the Y-axis. Draw a line to represent the best-fit straight line between the three points. Determine the GAD value of each serum sample using its absorbance value and extrapolating from the DRC on the X-axis.

For automatic calculations, absorbance of each serum sample must be converted into GAD values using a best-fit linear regression computer program. The GAD values indicated on each label of the calibrators should be entered as standards. The values are expressed as Units/ml.

**GAD SAMPLE DATA**

XI. Quality Control
Low and High Controls must be run along with unknown samples each time in order for the results to be valid.

XII. Performance Characteristics
Cross-reactivity
Interference from ANA, DNA, and Rheumatoid factors was not significantly observed. Serum samples with anti-Tg and Anti-TPO autoantibodies showed little or no cross-reactivity.

Precision
The reliability of the GAD ELISA test was assessed by examining its reproducibility using confirmed samples for GAD autoantibody.

Intra-Assay (within run):

XIII. Limitations and Sources
1. Although a higher GAD titer will produce a higher OD reading, the test is designed for the semi-quantitative determination of the GAD autoantibodies in test serum samples.

2. Poor test reproducibility may result from:
   a. Inconsistent delivery of reagents
   b. Improper storage of reagents
   c. Improper reconstitution of reagents
   d. Incomplete washing of microwells
   e. Substrate reagent old or exposed to light
f. Unstable/defective spectrophotometer

g. Error in following the assay procedure
